

Predicted Highly Observable Peptides

Pre AA	Sequence	Fol AA
K	IGVIENGPPLSFMVLAYILQR	E

Pre AA Preceding (towards the N-terminus)
Sequence Following (towards the C-terminus) aminoacid
Fol AA Aminoacid sequence of detected peptide

Supplementary Figure S1. $TRPV1_{850}$-Exon 6 is expressed in human cells. A) TRPV1 gene localization on Chromosome 17 (red box) and transcriptional direction is depicted by a black (Upper). Ensemble TRPV1 transcript IDs are shown on the right, while exons (filled boxes), non-coding exons (empty boxes), and introns (lines) are shown on the left side for each transcript. $TRPV1_{850}$-Exon 6 is shown as a red box. B) GTEx gene expression analysis on the IGV browser showing RNA-seq reads for the $TRPV1_{850}$-Exon 6 on specific tissues. The genomic sequence covering $TRPV1_{850}$-Exon 6 is shown above. C) Exon-6 DNA sequence, corresponding mRNA sequence, and encoded 11-amino-acid sequence, VIENGPPLSFM. The adjacent table shows the predicted exon-6–containing peptide, IGVIENGPPLSFMVLAYILQR, listed under “Predicted Highly Observable Peptides” in PeptideAtlas for protein ENSP00000409627.2. The exon-6–encoded residues are highlighted in red.
